

CARBON CERAMIC W6A BRAKE KIT

Wilwood's new carbon ceramic W6A brake kit:

Carbon ceramic brakes featuring space age technology started to be used on racecars in the past few years with excellent results. As so often happens, racing technology finds its way to high-performance street applications and so it is in the case of carbon ceramic rotors. High-end vehicles such as Ferraris and the new ZR1 Corvette now offer carbon ceramic rotors as standard equipment. Carbon ceramic rotors are difficult and expensive to produce, so their use had been limited due to cost considerations. There are many benefits associated with carbon ceramic brakes such as the rotors are very lightweight so a car will get an unsprung weight advantage for improved handling. The rotors also feature less rotational inertia, so it will take less horsepower to get them spinning and they have proven to be extremely long wearing, so rotor upgrades will be less frequent. The carbon ceramic rotors also have different thermal dynamic properties than iron rotors.

Big Brake Kit with Ceramic Rotor
Setup and W6A Caliper

Remaining on the leading edge of technology, Wilwood is now offering carbon ceramic brake systems for Corvettes, so your base Corvette can stop and decelerate as fast as a new ZR1. The new carbon ceramic brakes work great on the street and will provide better lap times on the track along with improving your Corvette's already fantastic handling performance. Wilwood is currently assessing other vehicle makes for possible kits.
