AEROLITE 6R FRONT BRAKE KIT WITH
14.00” DIAMETER GT VENTED ROTORS AND FLEXLINES

BASE PART NUMBER
140-17100

DISC BRAKES SHOULD ONLY BE INSTALLED BY SOMEONE EXPERIENCED AND COMPETENT IN THE INSTALLATION AND MAINTENANCE OF DISC BRAKES

READ ALL WARNINGS

WARNING
IT IS THE RESPONSIBILITY OF THE PERSON INSTALLING ANY BRAKE COMPONENT OR KIT TO DETERMINE THE SUITABILITY OF THE COMPONENT OR KIT FOR THAT PARTICULAR APPLICATION. IF YOU ARE NOT SURE HOW TO SAFELY USE THIS BRAKE COMPONENT OR KIT, YOU SHOULD NOT INSTALL OR USE IT. DO NOT ASSUME ANYTHING. IMPROPERLY INSTALLED OR MAINTAINED BRAKES ARE DANGEROUS. IF YOU ARE NOT SURE, GET HELP OR RETURN THE PRODUCT. YOU MAY OBTAIN ADDITIONAL INFORMATION AND TECHNICAL SUPPORT BY CALLING WILWOOD AT (805) 388-1188, OR VISIT OUR WEB SITE AT WWW.WILWOOD.COM. USE OF WILWOOD TECHNICAL SUPPORT DOES NOT GUARANTEE PROPER INSTALLATION. YOU, OR THE PERSON WHO DOES THE INSTALLATION MUST KNOW HOW TO PROPERLY USE THIS PRODUCT. IT IS NOT POSSIBLE OVER THE PHONE TO UNDERSTAND OR FORESEE ALL THE ISSUES THAT MIGHT ARISE IN YOUR INSTALLATION.

RACING EQUIPMENT AND BRAKES MUST BE MAINTAINED AND SHOULD BE CHECKED REGULARLY FOR FATIGUE, DAMAGE, AND WEAR.

WARNING
DO NOT OPERATE ANY VEHICLE ON UNTESTED BRAKES! SEE MINIMUM TEST PROCEDURE WITHIN

ALWAYS UTILIZE SAFETY RESTRAINT SYSTEMS AND ALL OTHER AVAILABLE SAFETY EQUIPMENT WHILE OPERATING THE VEHICLE

IMPORTANT • READ THE DISCLAIMER OF WARRANTY INCLUDED IN THE KIT

NOTE: Some cleaners may stain or remove the finish on brake system components. Test the cleaner on a hidden portion of the component before general use.

Need Additional Information? Use Your Smartphone and Jump to Our Technical Tips Section on Our Web Site.

DISC BRAKES

wilwood

www.wilwood.com
**Important Notice - Read This First**

Before any tear-down or disassembly begins, review the following information:

- Review the wheel clearance diagram (Figure 2, page 3) to verify that there is adequate clearance with the wheels you will be using with the installation.
- Due to OEM production differences and other variations from vehicle to vehicle, the fastener hardware and other components in this kit may not be suitable for a specific application or vehicle.
- It is the responsibility of the purchaser and installer of this kit to verify suitability / fitment of all components and ensure all fasteners and hardware achieve complete and proper engagement. Improper or inadequate engagement can lead to component failure.

**Photographic Tip**

*Important* and highly recommended: Take photos of brake system before disassembly and during the disassembly process. In the event, trouble-shooting photos can be life savers. Many vehicles have undocumented variations, photos will make it much simpler for Wilwood to assist you if you have a problem.

**Exploded Assembly Diagram**

Figure 1. Typical Installation Configuration
# General Information

Installation of this kit should ONLY be performed by persons experienced in the installation and proper operation of disc brake systems. Before assembling the Wilwood disc brake kit, double check the following items to ensure a trouble-free installation.

- Make sure this is the correct kit to fit the exact make and model year of your vehicle. This kit is designed specifically to fit 1999-2012 Porsche 911 (996/997).

- Inspect the package contents against the parts list to ensure that all components and hardware are included.

- Verify the hub stud pattern in this kit matches the lug pattern of the vehicles wheels.

- Verify your wheel clearance using Figure 2.

----

## Disassembly Instructions

- Disassemble the original equipment front brakes:

  Raise the front wheels off the ground and support the front suspension according to the vehicle manufacturer's instructions.

  Remove the front wheels, calipers, and rotors.

  **NOTE:** If vehicle is equipped with a brake pad wear sensor, it will not be used with the new Wilwood calipers. To prevent warning messages from displaying, the sensor wire must remain on the vehicle. Coil up the wire and securely strap it in an out of the way location, away from any moving or rotating components.

- Remove any nicks or burrs on the axle hub and upright that may interfere with the installation of the new brake components.

- Clean and de-grease the axle hub and upright assembly.

---

### Notes:

P/N 230-4572 Rotor Bolt Kit, includes part numbers 230-6737 and 240-11240

P/N 230-17381 Bracket Bolt Kit, includes part numbers 230-17155 and 240-11102

P/N 250-17380 Caliper Bracket Kit, includes part numbers 230-9080, 230-9182, 240-11101, and 250-17082

Item 4A is an optional item and included with the “-D” drilled rotor kits. Add “-D” to end of part number when ordering

Item 9A is an optional item and included with the “-R” red caliper kits. Add “-R” to end of part number when ordering

Item 9B is an optional item and included with the “-Y” yellow caliper kits. Add “-Y” to end of part number when ordering

---

---

---
Assembly Instructions

**NOTE:** Numbers in parenthesis refer to the parts list and Figure 1 on the preceding pages.

**STEP 1** The caliper mount bracket (1) should initially be installed with clean, dry threads on the mounting bolts. Orient the bracket as shown in Figure 1 and Photo 1, and install using bolts (2) and washers (3). Temporarily tighten the mounting bolts. **NOTE:** The bracket must fit squarely against the mount bosses on the upright. Inspect for interference from casting irregularities, machining ridges, burrs, etc. Remove each bolt one at a time, apply red Loctite® 271 to the threads, and torque to value shown in Figure 1.

**STEP 2** Orient the rotor (4) and the hat (5) as shown in Figure 1. Attach the hat to the rotor using bolts (6) and washers (7) as shown in Photos 2 and 3. Apply red Loctite® 271 to the bolt threads and torque to value shown in Figure 1. For an added measure of security, the bolts may be safety wired using standard 0.032 inch diameter stainless steel safety wire as shown in Figure 3. Please refer to Wilwood's data sheet DS-386 (available at www.wilwood.com/Pdf/DataSheets/ds386.pdf) for complete safety wire installation instructions.

**STEP 3** Slide the rotor/hat (4/5) assembly onto the hub, Photo 4. **NOTE:** The hat must fit flush against the hub flange or excessive rotor run out may result. Install the existing OEM hat locator screws as shown in Figure 1, Photo 4, to keep the hat/rotor assembly in place while continuing with the installation.

**STEP 4** Remove the two pad retaining pins from the caliper (9) by carefully popping out the pin retaining clips and sliding out the pins. Insert the brake pads (12) into the caliper from the bottom with the friction material facing the rotor, Figure 1 and Photo 5. Secure the brake pads in place with the pad retaining pins and clips, Photo 6. **STEP 5** **NOTE:** This kit contains distinct right and left hand calipers that must be mounted in a specific direction, as described below. Lubricate the caliper mounting studs (8) with lightweight oil. Mount the caliper (9) onto the bracket (1) using lock nuts (10) and washers (11), Figure 1. Ensure that the caliper is mounted so that the largest pistons are at the rotor exit end of the caliper, in relation to the direction of rotor rotation. Torque the caliper lock nuts (10) to value shown in Figure 1.
STEP 6 Temporarily install wheel and torque lug nuts to manufacturer’s specification. Ensure that the wheel rotates freely without any interference. Remove wheel for next step.

STEP 7 Attach supplied brake line to caliper. **NOTE:** OEM rubber brake hoses generally cannot be adapted to Wilwood calipers. Install Wilwood’s stainless steel braided flexline hose kit (13), P/N 220-17382, included with this kit, as shown in Photo 7. A new grommet for the flexline is included (arrow, Photo 7). The caliper inlet fitting is a 1/8-27 NPT. Use the included steel adapter inlet fitting at the caliper (use PTFE tape on the pipe threads of adapter fitting for proper sealing to caliper). Note the final orientation of the caliper inlet adapter fitting as shown in Photo 7. Mount the Wilwood brake line chassis adapter fitting into OEM bracket using the supplied retainer clip and attach the OEM hard line to new chassis adapter fitting. **NOTE:** OEM chassis brake line bracket may require modification to accommodate the new chassis adapter fitting. Use a round hand file to slightly increase hole diameter to fit the new chassis adapter fitting. Attach flexline to other end of chassis adapter fitting and then to caliper fitting. Note routing of flexline as shown in Photo 7.

**NOTE:** If vehicle is equipped with a brake pad wear sensor, it will not be used with the new Wilwood calipers. To prevent warning messages from displaying, the sensor wire must remain on the vehicle. Coil up the wire and securely strap it in an out of the way location, away from any moving or rotating components.

Ensure hoses are routed to prevent contact with moving suspension, brake or wheel components.

**NOTE:** Wilwood hose kits are designed for use in many different vehicle applications and it is the installer’s responsibility to properly route and provide adequate clearance and retention for brake hose components.

**NOTE:** Specified brake hose kits may not work with all Years, Makes and Models of vehicle that this brake kit is applicable to, due to possible OEM manufacturing changes during a production vehicle’s life.

**CAUTION:** In absence of specific instructions for brake line routing, the installer must use his best professional judgment on correct routing and retention of lines to ensure safe operation. It is the installer’s responsibility to ensure that all fittings and hoses are the correct size and length, properly seal, and that they will not be subject to crimping, strain and abrasion from vibration or interference with suspension components, brake rotor or wheel.

**STEP 8** Bleed the brake system, referring to the ‘Additional Information and Recommendations’ on page 6 for proper bleeding instructions. Check system for leaks after bleeding.

**STEP 9** Install the wheel and torque the lug nuts to manufacturer’s specifications.
Assembly Instructions (Continued)

- **CAUTION:** Test vehicle brake system per the ‘Minimum Test Procedure’ stated within this document before driving. After road testing, inspect for leaks and interference. Initially after install and testing, perform frequent checks of the vehicle brake system and lines before driving, to confirm that there is no undue wear or interference not apparent from the initial test. Afterwards, perform periodic inspections for function, leaks and wear in an interval relative to the usage of vehicle.

- **STEP 10** Bed-in the brake pads per the procedure on page 7.

Additional Information and Recommendations

- **NOTE:** With the installation of after market disc brakes, the wheel track may change depending on the application. Check your wheel offset before final assembly.

- Please read the following concerning balancing the brake bias on 4 wheel disc vehicles.

  This Porsche 911 kit can be operated using the stock OEM master cylinder. However, as with most suspension and tire modifications (from OEM specifications), changing the brakes may alter the front to rear brake bias. Rear brakes should not lock up before the front. Brake system evaluation and tests should be performed by persons experienced in the installation and proper operation of brake systems. Evaluation and tests should be performed under controlled conditions. Start by making several stops from low speeds then gradually work up to higher speeds. Always utilize safety restraint systems while operating vehicle.

- For optimum performance, fill and bleed the new system with Wilwood Hi-Temp° 570 grade fluid or EXP 600 Plus. For severe braking or sustained high heat operation, use Wilwood EXP 600 Plus Racing Brake Fluid. Used fluid must be completely flushed from the system to prevent contamination. **NOTE:** Silicone DOT 5 brake fluid is NOT recommended for racing or performance driving.

- To properly bleed the brake system, begin with the caliper farthest from the master cylinder. Bleed the outboard bleed screw first, then the inboard. Repeat the procedure until all calipers in the system are bled, ending with the caliper closest to the master cylinder. If the caliper is fitted with bleed screws on four corners, make sure the bottom bleed screws are tight. Only bleed from the top bleed screws. **NOTE:** When using a new master cylinder, it is important to bench bleed the master cylinder first.

- Test the brake pedal. It should be firm, not spongy, and stop at least 1 inch from the floor under heavy load.

  If the brake pedal is spongy, bleed the system again.

  If the brake pedal is initially firm, but then sinks to the floor, check the system for leaks. Correct the leaks (if applicable) and then bleed the system again.

  If the brake pedal goes to the floor and continued bleeding of the system does not correct the problem, either air may be trapped in the system, or a master cylinder with increased capacity (larger bore diameter) may be required. Wilwood offers various lightweight master cylinders with large fluid displacement capacities (custom fabricated mounting may be required).
Brake Testing

**WARNING • DO NOT DRIVE ON UNTESTED BRAKES**
**BRAKES MUST BE TESTED AFTER INSTALLATION OR MAINTENANCE**
**MINIMUM TEST PROCEDURE**

- Make sure pedal is firm: Hold firm pressure on pedal for several minutes, it should remain in position without sinking. If pedal sinks toward floor, check system for fluid leaks. DO NOT drive vehicle if pedal does not stay firm or can be pushed to the floor with normal pressure.

- At very low speed (2-5 mph) apply brakes hard several times while turning steering from full left to full right, repeat several times. Remove the wheels and check that components are not touching, rubbing, or leaking.

- Carefully examine all brake components, brake lines, and fittings for leaks and interference.

- Make sure there is no interference with wheels or suspension components.

- Drive vehicle at low speed (15-20 mph) making moderate and hard stops. Brakes should feel normal and positive. Again check for leaks and interference.

- Always test vehicle in a safe place where there is no danger to (or from) other people or vehicles.

- Always wear seat belts and make use of all safety equipment.

Pad and Rotor Bedding

**BEDDING STEPS FOR NEW PADS AND ROTORS – ALL COMPOUNDS**

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

- Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.

- After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.

- Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.

- If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.

- Drive at a moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

**COMPETITION VEHICLES**

- If your race car is equipped with brake cooling ducts, blocking them will allow the pads and rotors to warm up quicker and speed up the bedding process.

- Temperature indicating paint on the rotor and pad edges can provide valuable data regarding observed temperatures during the bedding process and subsequent on-track sessions. This information can be highly beneficial when evaluating pad compounds and cooling efficiencies.
Pad and Rotor Bedding (Continued)

POST-BEDDING INSPECTION – ALL VEHICLES
• After the bedding cycle, the rotors should exhibit a uniformly burnished finish across the entire contact face. Any surface irregularities that appear as smearing or splotching on the rotor faces can be an indication that the brakes were brought up to temperature too quickly during the bedding cycle. If the smear doesn’t blend away after the next run-in cycle, or if chatter under braking results, sanding or resurfacing the rotors will be required to restore a uniform surface for pad contact.

PRE-RACE WARM UP
• Always make every effort to get heat into the brakes prior to each event. Use an on-and-off the pedal practice to warm the brakes during the trip to the staging zone, during parade laps before the flag drops, and every other opportunity in an effort to build heat in the pads and rotors. This will help to ensure best consistency, performance, and durability from your brakes.

DYNO BEDDED COMPETITION PADS AND ROTORS
• Getting track time for a proper pad and rotor bedding session can be difficult. Wilwood offers factory dyno-bedded pads and rotors on many of our popular competition pads and Spec 37 GT series rotors. Dyno-bedded parts are ready to race on their first warm up cycle. This can save valuable time and effort when on-track time is either too valuable or not available at all, Dyno-bedding assures that your pads and rotors have been properly run-in and are ready to go. Contact your dealer or the factory for more information on Wilwood Dyno-Bedding services.

NOTE: NEVER allow the contact surfaces of the pads or rotors to be contaminated with brake fluid. Always use a catch bottle with a hose to prevent fluid spill during all brake bleeding procedures.
