WARNING
IT IS THE RESPONSIBILITY OF THE PERSON INSTALLING ANY BRAKE COMPONENT OR KIT TO DETERMINE THE SUITABILITY OF THE COMPONENT OR KIT FOR THAT PARTICULAR APPLICATION. IF YOU ARE NOT SURE HOW TO SAFELY USE THIS BRAKE COMPONENT OR KIT, YOU SHOULD NOT INSTALL OR USE IT. DO NOT ASSUME ANYTHING. IMPROPERLY INSTALLED OR MAINTAINED BRAKES ARE DANGEROUS. IF YOU ARE NOT SURE, GET HELP OR RETURN THE PRODUCT. YOU MAY OBTAIN ADDITIONAL INFORMATION AND TECHNICAL SUPPORT BY CALLING WILWOOD AT (805) 388-1188, OR VISIT OUR WEB SITE AT WWW.WILWOOD.COM. USE OF WILWOOD TECHNICAL SUPPORT DOES NOT GUARANTEE PROPER INSTALLATION. YOU, OR THE PERSON WHO DOES THE INSTALLATION MUST KNOW HOW TO PROPERLY USE THIS PRODUCT. IT IS NOT POSSIBLE OVER THE PHONE TO UNDERSTAND OR FORESEE ALL THE ISSUES THAT MIGHT ARISE IN YOUR INSTALLATION.

RACING EQUIPMENT AND BRAKES MUST BE MAINTAINED AND SHOULD BE CHECKED REGULARLY FOR FATIGUE, DAMAGE, AND WEAR.

WARNING
DO NOT OPERATE ANY VEHICLE ON UNTESTED BRAKES!
SEE MINIMUM TEST PROCEDURE WITHIN
ALWAYS UTILIZE SAFETY RESTRAINT SYSTEMS AND ALL OTHER AVAILABLE SAFETY EQUIPMENT WHILE OPERATING THE VEHICLE

IMPORTANT • READ THE DISCLAIMER OF WARRANTY INCLUDED IN THE KIT

NOTE: Some cleaners may stain or remove the finish on brake system components. Test the cleaner on a hidden portion of the component before general use.
Important Notice - Read This First

Before any tear-down or disassembly begins, review the following information:
• A substantial amount of modifications are required to the stock steering arm/spindle. These include drilling and tapping three holes as well as removing two “ears” that will interfere with the assembly of the Wilwood disc brake kit. It is recommended that these modifications be performed by a qualified machine shop. Keep in mind that this may require a substantial amount of time. Therefore, the vehicle may be inoperable for longer than anticipated.
• Review the wheel clearance diagram (figure 3, page 4) to verify that there is adequate clearance with the wheels you will be using with the installation.
• This brake kit does not include flex lines. OEM brake lines will not adapt to Wilwood calipers. Check the assembly instructions, or associated components section for brake line recommendations before assembly. In addition, Wilwood offers an extensive listing of brake lines and fittings on our web site: www.wilwood.com.
• Due to OEM production differences and other variations from vehicle to vehicle, the fastener hardware and other components in this kit may not be suitable for a specific application or vehicle.
• It is the responsibility of the purchaser and installer of this kit to verify suitability / fitment of all components and ensure all fasteners and hardware achieve complete and proper engagement. Improper or inadequate engagement can lead to component failure.

Photographic Tip

Important and highly recommended: Take photos of brake system before disassembly and during the disassembly process. In the event, trouble-shooting photos can be life savers. Many vehicles have undocumented variations, photos will make it much simpler for Wilwood to assist you if you have a problem.

General Information

Installation of this kit should ONLY be performed by persons experienced in the installation and proper operation of disc brake systems. Before assembling the Wilwood front disc brake kit, double check the following items to ensure a trouble-free installation.

• Make sure this is the correct kit to match the exact make and model year of the vehicles spindle (i.e., hubs for a 1975 General Motors spindle will not fit a 1982 spindle).

• Verify the hub stud pattern in this kit matches the stud pattern of the vehicles wheels.

• Verify your wheel clearance using Figure 3.

• Inspect the package contents against the parts list to ensure that all components and hardware are included.

Disassembly Instructions

• Disassemble the original equipment front brakes:

  Raise the front wheels off the ground and support the front suspension according to the vehicle manufacturer’s instructions.

  Remove caliper slide pins. Disconnect brake hose from brake line at the body. Remove brake caliper, pads and hose as an assembly.

  Remove center cap, cotter pin, nut lock and wheel bearing nut and washer. Remove brake rotor and hub assembly, including wheel bearings. Remove disc brake dust shield assembly by removing attaching bolts. Dust shield and bolts will not be reused in assembly.

  Clean and de-grease the spindles. Remove all nicks or burrs on the spindle snout and threads. Remove any of the backing plate gasket which may remain on the spindles. Remove any scale or rust from the gasket area.

Steering Arm / Spindle Modifications

These modifications should be performed by a qualified machinist. Refer to Figure 1 on the following page as necessary (numbers in parenthesis refer to the parts list on page three). Only one view of the steering arm/spindle is shown, but the modifications need to be performed on both steering arm/spindles.

Modification Procedure

The three stock holes that will be used to mount the caliper mounting bracket (1) need to be modified. Drill a .332 diameter hole through all three holes, then tap 3/8-24 UNF (fine thread). Countersink the holes to .438 x 90°. The “ears” that protrude to form a “C” shape need to be removed to facilitate the installation of the Wilwood caliper (19). Using the caliper mounting bracket (1) as a template, mark two cut marks on the steering arm. Remove as little as necessary from the “C” shape, being careful not to cut away any of the mounting holes required to bolt on the caliper mounting bracket (1).
THESE 3 HOLES NEED TO BE MODIFIED. DRILL A .332 DIA HOLE 1.00" DEEP AND TAP 3/8-24 UNF (FINE THREAD). COUNTERSINK .438 x 90°. SEE DRILL HOLE DETAIL, BELOW.

CUT AWAY

IMAGINARY SHEAR LINE. USE THE CALIPER MOUNTING BRACKET (1) AS A TEMPLATE TO CUT AWAY THIS PORTION OF THE OEM SPINDLE. CUT AWAY AS LITTLE AS POSSIBLE BEING CAREFUL NOT TO CUT AWAY ANY OF THE MOUNTING HOLES.

NOTES: Part Number 230-3829 Bolt Kit, adapter plate to hub, includes part number 230-11239
Part Number 230-3328 Bolt Kit, rotor to adapter plate, includes part number 230-2043
Part Number 230-0204 Bolt Kit, caliper to bracket, includes part numbers 230-0228, 240-10190 and 240-1159

Item 11A is an optional item and is included in the (D) drilled kits
Item 19A is an optional item and is included in the (P) polished kits
**Assembly Instructions**

**NOTE:** Numbers in parenthesis refer to the parts list and Figure 1 on the preceding pages.

**CAUTION:** All mounting bolts must fully engage clinch nuts. Be sure to check that all bolts are either flush or protruding through flanged side of clinch nut after shimming.

• Identify the left and right caliper mounting brackets (1). Both brackets will be offset to the rear of the vehicle with the threaded inserts and the beveled bolt holes facing the outside of the vehicle. Apply red Loctite® 271 to bolt threads (2 and 3) before assembly of the caliper bracket (1) to backing plate face of spindle. Insert the two longer mounting bolts (3) and the shorter mounting bolt (2) through the caliper mounting bracket (1). Place one mounting bracket spacer (4) over each of the longer mounting bolts (3). Slide a washer (5) over the shorter mounting bolt (2). Position the caliper mounting bracket (1) onto the spindle, slipping each of the three mounting bolts (2 and 3) into the threaded spindle holes, finger tighten. Torque three bolts (2 and 3) to 30 ft-lb. **NOTE:** Be sure the heads of the caliper bracket (1) insert nuts are facing outward toward the wheel.

• Install five new wheel studs (6) into the hub (7). Torque to 77 ft-lb. **NOTE:** There are two (2) five lug patterns in the hub (5 x 4.50 and 5 x 4.75). Make sure of the correct hole pattern for the correct wheel application before installing studs into hub.

• Pack the large inner bearing cone (8) with high temperature disc brake bearing grease (available from your local auto parts store) and install into the backside of the hub (7).

---

**Figure 2. Typical Installation Configuration**

**Figure 3. Wheel Clearance Diagram**
• Install the grease seal (9) by pressing into the backside of the hub (7).

• Attach rotor adapter (10) to rotor (11) using six bolts (12). Torque bolts (12 to 180 in-lb. Safety wire bolts (12) using standard 0.032 inch diameter stainless steel safety wire as shown in Figure 4. Please refer to Wilwood’s data sheet DS-386 (available at www.wilwood.com/Pdf/DataSheets/ds386.pdf) for complete safety wire installation instructions. NOTE: The flat side of the rotor (11) lugs face toward the rotor adapter (10) with the dished side of the rotor adapter (10) facing away from the rotor (11).

• Mount the adapter/rotor assembly (10/11) to the hub (7) using bolts (13) (finger tight), as shown in Figure 1. Apply red Loctite® 271 to the bolt threads and torque to 45 ft-lbs using a criss-cross pattern.

• Pack the small outer bearing cone (14) with high temperature disc brake bearing grease. Lightly coat the spindle bearing surfaces with bearing grease. Slide the hub/rotor assembly (7 and 11) with outer bearing cone (14) onto the spindle. Secure using spindle washer (15), existing adjusting nut and nut locking device. NOTE: Because of a tolerance variation among spindles, it may be necessary to install a shim washer (16) between the spindle washer (15) and the spindle nut if the spindle nut will not tighten down all the way. There are four supplied in the kit for your convenience.

• Bearing adjustment:
  Tighten the wheel bearing nut to 60 in-lb while turning the hub/rotor assembly (7 and 11). Position the nut lock on the wheel bearing nut with one pair of slots in-line with (covering) the cotter pin hole. Back off the adjusting nut lock assembly one slot and install a new cotter pin. The resulting adjustment should be zero (no pre-load) to 0.003 inch end play.

• Install the dust cap (18) onto the hub (7). Friction created by the o-ring (17) on the dust cap (18) keeps it from unscrewing. The O.D. of the existing spindle washer may be larger than the I.D. of the dust cap (18) which may allow the washer to contact the dust cap (18). Use the spindle washer (16) supplied with the kit instead of the stock washer.

• NOTE: Please reference the caution statement at the beginning of the assembly instructions. Mount the caliper (19) onto the caliper bracket (1) using two bolts (21), two washers (20) and two 0.032 inch thick shims (22). Finger tighten. View the rotor (11) through the top of the caliper (19). The rotor (11) should be aligned in the center of the caliper (19). If not, loosen the two bolts (21) and adjust the caliper (19) by using 0.032 inch thick shim washers (22). The shim washers (22) should be placed between the caliper (19) and the caliper mounting bracket (1). Finger tighten and recheck alignment. Add as many shim washers (22) as necessary to achieve the correct alignment. NOTE: The end of the bolt must be flush with or slightly protruding from the head of the clinch nut. See Figure 5. Place spare shims (22) between washer and caliper mounting ear to achieve the proper mounting fastener configuration. Always use the same amount of shims on both the top and bottom caliper mounting bolts (21). Loosen the two bolts (21) and apply red Loctite® 271 to the bolt threads (21) and torque to 40 ft-lb. Safety wire the two bolts (21).

• Install the disc brake pads (23) into the caliper (19). Secure the disc brake pads to the caliper utilizing cotter pin (24).

• Repeat the above steps for the other wheel.

• NOTE: OEM rubber brake hoses generally cannot be adapted to Wilwood calipers. The caliper inlet fitting is a 1/8-27 NPT. The preferred method is to use steel adapter fittings at the caliper, either straight, 45 or 90 degree (use PTFE tape on pipe threads of adapter fitting for proper sealing to caliper) and enough steel braided line to allow for full suspension travel and turning radius, lock to lock. Carefully route lines to prevent contact with moving suspension, brake or wheel components. Wilwood hose kits are designed for use in many different vehicle applications and it is the installer’s responsibility to properly route and ensure adequate clearance and retention for brake hose components.
Assembly Instructions (Continued)

- Specified brake hose kits may not work with all Years, Makes and Models of vehicle that this brake kit is applicable to, due to possible OEM manufacturing changes during a production vehicle’s life. It is the installer’s responsibility to ensure that all fittings and hoses are the correct size and length, to ensure proper sealing and that they will not be subject to crimping, strain and abrasion from vibration or interference with suspension components, brake rotor or wheel.

- In absence of specific instructions for brake line routing, the installer must use his best professional judgment on correct routing and retention of lines to ensure safe operation. Test vehicle brake system per the ‘Minimum Test Procedure’ stated within this document before driving. After road testing, inspect for leaks and interference. Initially after install and testing, perform frequent checks of the vehicle brake system and lines before driving, to confirm that there is no undue wear or interference not apparent from the initial test. Afterwards, perform periodic inspections for function, leaks and wear in a interval relative to the usage of vehicle.

- Bleed the brake system. Reference the ‘Additional Information and Recommendations’ on page 7 for proper bleeding instructions.

- Bed-in the brake pads per the procedure on page 8.

Balancing the Brake Bias on 4 Wheel Disc Vehicles

- OE Style or Single Mount Race Pedal with Tandem Outlet Master Cylinder:
  Front to rear caliper piston sizes, rotor diameters, and pad compounds must be initially configured to provide the correct range of vehicle bias when using a single bore / tandem outlet master cylinder. If excessive rear brake bias is experienced, an inline adjustable proportioning valve can be used to decrease the rear line pressure to help bring the vehicle into balance. If excessive front brake bias is experienced, first consideration should be given to increasing the rear brake bias to bring the vehicle into overall balance.

- Race Pedal with Dual Master Cylinders and Balance Bar:
  Master cylinders must be sized to match the calipers and allow the pedal balance bar to operate near the center of its travel. If it is not possible to fine tune the bias within the adjustable range of the balance bar, then consideration must be given to changing a master cylinder bore size or some other aspect of the brake system to bring the car into balance. Larger bore master cylinders will generate less pressure while decreasing pedal travel. Smaller bores master cylinders will generate higher line pressures with an increase in pedal travel.
Additional Information and Recommendations

- Fill and bleed the new system with Wilwood Hi-Temp° 570 grade fluid or higher. For severe braking or sustained high heat operation, use Wilwood EXP 600 Plus Racing Brake Fluid. Used fluid must be completely flushed from the system to prevent contamination. **NOTE:** Silicone DOT 5 brake fluid is **NOT** recommended for racing or performance driving.

- To properly bleed the brake system, begin with the caliper farthest from the master cylinder. Bleed the outboard bleed screw first, then the inboard. Repeat the procedure until all calipers in the system are bled, ending with the caliper closest to the master cylinder. **NOTE:** When using a new master cylinder, it is important to bench bleed the master cylinder first.

- If the master cylinder is mounted lower than the disc brake calipers, some fluid flowback to the master cylinder reservoir may occur, creating a vacuum effect that retracts the caliper pistons into the housing. This will cause the pedal to go to the floor on the first stroke until it has “pumped up” and moved all the pistons out against the pad again. A Wilwood in-line two pound residual pressure valve, installed near the master cylinder will stop the fluid flowback and keep the pedal firm and responsive.

- Test the brake pedal. It should be firm, not spongy and stop at least 1 inch from the floor under heavy load.
  
  If the brake pedal is spongy, bleed the system again.
  
  If the brake pedal is initially firm, but then sinks to the floor, check the system for fluid leaks. Correct the leaks (if applicable) and then bleed the system again.
  
  If the brake pedal goes to the floor and continued bleeding of the system does not correct the problem, a master cylinder with increased capacity (larger bore diameter) will be required. Wilwood offers various lightweight master cylinders with large fluid displacement capacities.

  **NOTE:** With the installation of after market disc brakes, the wheel track may change depending on the application. Check your wheel offset before final assembly.

- On some models of disc brake spindles there are “ears” where the OEM calipers were mounted and these “ears” interfere with the assembly of the Wilwood disc brake kit. If it becomes necessary to remove these “ears”, remove as little as possible being careful not to cut away any of the mounting holes that may be required to bolt on the caliper mounting bracket.

- If after following the instructions, you still have difficulty in assembling or bleeding your Wilwood disc brakes, consult your local chassis builder, or retailer where the kit was purchased for further assistance.
BEDDING STEPS FOR NEW PADS AND ROTORS – ALL COMPOUNDS

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

• Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.

• After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.

• Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.

• If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.

• Drive at a moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

COMPETITION VEHICLES

• If your race car is equipped with brake cooling ducts, blocking them will allow the pads and rotors to warm up quicker and speed up the bedding process.

• Temperature indicating paint on the rotor and pad edges can provide valuable data regarding observed temperatures during the bedding process and subsequent on-track sessions. This information can be highly beneficial when evaluating pad compounds and cooling efficiencies.
POST-BEDDING INSPECTION – ALL VEHICLES

• After the bedding cycle, the rotors should exhibit a uniformly burnished finish across the entire contact face. Any surface irregularities that appear as smearing or splotching on the rotor faces can be an indication that the brakes were brought up to temperature too quickly during the bedding cycle. If the smear doesn’t blend away after the next run-in cycle, or if chatter under braking results, sanding or resurfacing the rotors will be required to restore a uniform surface for pad contact.

PRE-RACE WARM UP

• Always make every effort to get heat into the brakes prior to each event. Use an on-and-off the pedal practice to warm the brakes during the trip to the staging zone, during parade laps before the flag drops, and every other opportunity in an effort to build heat in the pads and rotors. This will help to ensure best consistency, performance, and durability from your brakes.

DYNO BEDDED COMPETITION PADS AND ROTORS

• Getting track time for a proper pad and rotor bedding session can be difficult. Wilwood offers factory dyno-bedded pads and rotors on many of our popular competition pads and Spec 37 GT series rotors. Dyno-bedded parts are ready to race on their first warm up cycle. This can save valuable time and effort when on-track time is either too valuable or not available at all, Dyno-bedding assures that your pads and rotors have been properly run-in and are ready to go. Contact your dealer or the factory for more information on Wilwood Dyno-Bedding services.

NOTE: NEVER allow the contact surfaces of the pads or rotors to be contaminated with brake fluid. Always use a catch bottle with a hose to prevent fluid spill during all brake bleeding procedures.
