NOTE: Some cleaners may stain or remove the finish on brake system components. Test the cleaner on a hidden portion of the component before general use.
Important Notice - Read This First

Before any tear-down or disassembly begins, review the following information:
• It is the responsibility of the purchaser and installer of this kit to verify suitability / fitment of all components and ensure all fasteners and hardware achieve complete and proper engagement. Improper or inadequate engagement can lead to component failure.

Photographic Tip

Important and highly recommended: Take photos of brake system before disassembly and during the disassembly process. In the event, trouble-shooting photos can be life savers. Many vehicles have undocumented variations, photos will make it much simpler for Wilwood to assist you if you have a problem.

Exploded Assembly Diagram

WARNING
INSTALLATION OF THIS KIT SHOULD ONLY BE PERFORMED BY PERSONS EXPERIENCED IN THE INSTALLATION AND PROPER OPERATION OF DISC BRAKE SYSTEMS.

NOTE
SPECIFIC PARTS MAY VARY FROM DIAGRAM

Figure 1. Typical Installation Configuration
Disassemble the existing rear brakes. Raise the rear wheels off the ground and support the rear suspension per applicable safety guidelines.

Clean the axle and bracket mounts on the birdcage. Remove any nicks or burrs.

NOTE: Numbers in parenthesis refer to the parts list and Figure 1 on the preceding pages.

CAUTION: All mounting bolts must fully engage clinch nuts. Be sure to check that all bolts are either flush or protruding through flanged side of clinch nut.

Orient the caliper mount bracket (1) as shown in Figure 1, and install using bolts (2), and washers (3). Ensure that the flanged heads of the clinch nuts in the bracket are facing outboard. Temporarily tighten the mounting bolts. NOTE: The bracket must fit squarely against the mount bosses on the birdcage. Inspect for interference from machining ridges, burrs, etc. Remove bolts one at a time, apply red Loctite® 271 to the threads and torque to 40 ft-lb. For an added measure of security, the bolts may be safety wired using standard 0.032 inch diameter stainless steel safety wire as shown in Figure 2. Please refer to Wilwood’s data sheet DS-386 (available at www.wilwood.com/Pdf/DataSheets/ds386.pdf) for complete safety wire installation instructions.

Mount the rotor adapter (6) with the notched t-nut slots facing away from the rotor (5) using bolts (7), washers (8), and t-nuts (9) as shown in Figure 1. Apply red Loctite® 271 to the bolt threads before installing. Finger tighten. After all t-nuts have been installed, torque bolts in an alternating sequence to 120 in-lb. Please refer to Wilwood’s data sheet DS-669 (available at www.wilwood.com/Pdf/DataSheets/ds669.pdf) for complete t-nut bolt kit installation instructions.

NOTE: Installation of this kit should ONLY be performed by individuals experienced in the installation and proper operation of disc brake systems. Prior to any attempt to install this kit, please check the following to ensure a trouble free installation.

Inspect the contents of this kit against the parts list to ensure that all components and hardware are included.

Make sure this is the correct kit to fit your axle. This kit is designed for direct bolt-on installation to standard right rear outboard sprint car applications with a 3” diameter, 42 spline axle.

Disassembly Instructions (If Applicable)

Disassemble the existing rear brakes. Raise the rear wheels off the ground and support the rear suspension per applicable safety guidelines.

Clean the axle and bracket mounts on the birdcage. Remove any nicks or burrs.

Assembly Instructions

NOTE: Numbers in parenthesis refer to the parts list and Figure 1 on the preceding pages.

BEGIN BY SLIDING THE 0.032" DIAMETER WIRE THROUGH TWO OF THE HOLES (LEFT) THAT ARE 180° APART. TWIST THE WIRE AS SHOWN (BELOW) USING SAFETY WIRE PLIERS. NOW SLIDE ONE WIRE THROUGH TWO OF THE HOLES (180° APART) AND WRAP THE OTHER WIRE AROUND THE BOLT. TWIST THE WIRES TOGETHER TO FORM A PIGTAIL. SEE DS-386 FOR COMPLETE DETAILS.

Figure 2. Safety Wire Diagram

PartNumber 230-10800 T-Nut Bolt Kit, includes part numbers 230-10795, 240-11240, and 300-8429
PartNumber 230-0204 Caliper Mounting Bolt Kit, includes part numbers 230-0228 (only two required), 240-1159, and 240-10190 (only two required)
Assembly Instructions (Continued)

- Mount the caliper (10) onto the bracket (1) using customer supplied hardware, Figure 1. Initially place one .035” thick shim (4) and spacer (13) on each bolt between the caliper and bracket as shown in Figure 1. Temporarily tighten the bolts/nuts and view the rotor through the top opening of the caliper. The rotor should be centered in the caliper. If not, adjust by adding or subtracting shims (4) between the bracket and the caliper mount lugs. Once the caliper alignment is correct, torque customer supplied mounting hardware as required. Use of red Loctite® 271 is recommended.

- Remove the pad pin retainer (12) from the caliper (10). Slide the brake pads (11) into place. They should install easily without interference. Reinstall the pad pin retainer.

  **NOTE:** Rubber brake hoses are not recommended for competition use and generally cannot be adapted to Wilwood calipers. The caliper inlet fitting is a 1/8-27 NPT. The preferred method is to use steel 1/8-27 AN (37 degree) fittings at the caliper (use PTFE tape on pipe threads for proper sealing to caliper) and enough steel braided line to allow for full suspension travel. Carefully route lines to prevent contact with moving suspension, brake or wheel components. It is the installer’s responsibility to properly route and ensure adequate clearance and retention for brake hose components.

- It is also the installer’s responsibility to ensure that all fittings and hoses are the correct size and length, to ensure proper sealing and that they will not be subject to crimping, strain and abrasion from vibration or interference with suspension components, brake rotor, or wheel.

  In absence of specific instructions for brake line routing, the installer must use his best professional judgment on correct routing and retention of lines to ensure safe operation. Test vehicle brake system per the ‘minimum test’ procedure stated within this document before driving. After road testing, inspect for leaks and interference. Initially after install and testing, perform frequent checks of the vehicle brake system and lines before driving, to confirm that there is no undue wear or interference not apparent from the initial test. Afterwards, perform periodic inspections for function, leaks and wear in a interval relative to the usage of vehicle.

- Bleed the brake system. Reference the general information and recommendations below for proper bleeding instructions. Check system for leaks after bleeding.

- Bed-in the brake pads per the procedure on page 5.

Additional Information and Recommendations

- For optimum performance, fill and bleed the new system with Wilwood Hi-Temp° 570 grade fluid or EXP 600 Plus. For severe braking or sustained high heat operation, use Wilwood EXP 600 Plus Racing Brake Fluid. Used fluid must be completely flushed from the system to prevent contamination. **NOTE:** Silicone DOT 5 brake fluid is NOT recommended for racing or performance driving.

- To properly bleed the brake system, begin with the caliper farthest from the master cylinder. Bleed the outboard bleed screw first, then the inboard. Repeat the procedure until all calipers in the system are bled, ending with the caliper closest to the master cylinder. If the caliper is fitted with bleed screws on four corners, make sure the bottom bleed screws are tight. Only bleed from the top bleed screws. **NOTE:** When using a new master cylinder, it is important to bench bleed the master cylinder first.

- Test the brake pedal. It should be firm, not spongy, and stop at least 1 inch from the floor under heavy load.

  If the brake pedal is spongy, bleed the system again.

  If the brake pedal is initially firm, but then sinks to the floor, check the system for leaks. Correct the leaks (if applicable) and then bleed the system again.

  If the brake pedal goes to the floor and continued bleeding of the system does not correct the problem, either air may be trapped in the system, or a master cylinder with increased capacity (larger bore diameter) may be required. Wilwood offers various lightweight master cylinders with large fluid displacement capacities (custom fabricated mounting may be required).
Bedding Steps for New Pads and Rotors – All Compounds

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

- Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.

- After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.

- Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.

- If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.

- Drive vehicle at moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

- Always test vehicle in a safe place where there is no danger to (or from) other people or vehicles.

- Always wear seat belts and make use of all safety equipment.

Pad and Rotor Bedding

Bedding Steps for New Pads and Rotors – All Compounds

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

- Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.

- After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.

- Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.

- If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.

- Drive vehicle at moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

Competitive Vehicles

- If your race car is equipped with brake cooling ducts, blocking them will allow the pads and rotors to warm up quicker and speed up the bedding process.

- Temperature indicating paint on the rotor and pad edges can provide valuable data regarding observed temperatures during the bedding process and subsequent on-track sessions. This information can be highly beneficial when evaluating pad compounds and cooling efficiencies.
POST-BEDDING INSPECTION – ALL VEHICLES

• After the bedding cycle, the rotors should exhibit a uniformly burnished finish across the entire contact face. Any surface irregularities that appear as smearing or splotching on the rotor faces can be an indication that the brakes were brought up to temperature too quickly during the bedding cycle. If the smear doesn’t blend away after the next run-in cycle, or if chatter under braking results, sanding or resurfacing the rotors will be required to restore a uniform surface for pad contact.

PRE-RACE WARM UP

• Always make every effort to get heat into the brakes prior to each event. Use an on-and-off the pedal practice to warm the brakes during the trip to the staging zone, during parade laps before the flag drops, and every other opportunity in an effort to build heat in the pads and rotors. This will help to ensure best consistency, performance, and durability from your brakes.

DYNO BEDDED COMPETITION PADS AND ROTORS

• Getting track time for a proper pad and rotor bedding session can be difficult. Wilwood offers factory dyno-bedded pads and rotors on many of our popular competition pads and Spec 37 GT series rotors. Dyno-bedded parts are ready to race on their first warm up cycle. This can save valuable time and effort when on-track time is either too valuable or not available at all, Dyno-bedding assures that your pads and rotors have been properly run-in and are ready to go. Contact your dealer or the factory for more information on Wilwood Dyno-Bedding services.

NOTE: NEVER allow the contact surfaces of the pads or rotors to be contaminated with brake fluid. Always use a catch bottle with a hose to prevent fluid spill during all brake bleeding procedures.
