

ASSEMBLY INSTRUCTIONS
FOR
**AEROLITE 6R FRONT BRAKE KIT WITH 14.00" DIAMETER
CARBON CERAMIC ROTOR FOR WILWOOD PROSPINDLE***

*For additional vehicle compatibility, visit www.wilwood.com

BASE PART NUMBER

140-13145-CSIC

**DISC BRAKES SHOULD ONLY BE INSTALLED BY SOMEONE
EXPERIENCED AND COMPETENT IN THE INSTALLATION AND
MAINTENANCE OF DISC BRAKES
READ ALL WARNINGS**

WARNING

IT IS THE RESPONSIBILITY OF THE PERSON INSTALLING ANY BRAKE COMPONENT OR KIT TO DETERMINE THE SUITABILITY OF THE COMPONENT OR KIT FOR THAT PARTICULAR APPLICATION. IF YOU ARE NOT SURE HOW TO SAFELY USE THIS BRAKE COMPONENT OR KIT, YOU SHOULD NOT INSTALL OR USE IT. DO NOT ASSUME ANYTHING. IMPROPERLY INSTALLED OR MAINTAINED BRAKES ARE DANGEROUS. IF YOU ARE NOT SURE, GET HELP OR RETURN THE PRODUCT. YOU MAY OBTAIN ADDITIONAL INFORMATION AND TECHNICAL SUPPORT BY CALLING WILWOOD AT (805) 388-1188, OR VISIT OUR WEB SITE AT WWW.WILWOOD.COM. USE OF WILWOOD TECHNICAL SUPPORT DOES NOT GUARANTEE PROPER INSTALLATION. **YOU**, OR THE PERSON WHO DOES THE INSTALLATION MUST KNOW HOW TO PROPERLY USE THIS PRODUCT. IT IS NOT POSSIBLE OVER THE PHONE TO UNDERSTAND OR FORESEE ALL THE ISSUES THAT MIGHT ARISE IN YOUR INSTALLATION.

RACING EQUIPMENT AND BRAKES MUST BE MAINTAINED AND SHOULD BE CHECKED REGULARLY FOR FATIGUE, DAMAGE, AND WEAR.

Need Additional Information? Use Your
SmartPhone and Jump to Our Technical
Tips Section on Our Web Site.

DISC BRAKES
wilwood

WARNING

DO NOT OPERATE ANY VEHICLE ON UNTESTED BRAKES!
SEE MINIMUM TEST PROCEDURE WITHIN

ALWAYS UTILIZE SAFETY RESTRAINT SYSTEMS AND ALL OTHER AVAILABLE SAFETY EQUIPMENT WHILE OPERATING THE VEHICLE

IMPORTANT • READ THE DISCLAIMER OF WARRANTY INCLUDED IN THE KIT

NOTE: Some cleaners may stain or remove the finish on brake system components. Test the cleaner on a hidden portion of the component before general use.

Exploded Assembly Diagram and Parts List

WARNING
 INSTALLATION OF THIS KIT SHOULD **ONLY** BE PERFORMED BY PERSONS EXPERIENCED IN THE INSTALLATION AND PROPER OPERATION OF DISC BRAKE SYSTEMS.

NOTE
 SPECIFIC PARTS MAY VARY FROM DIAGRAM

THESE COMPONENTS ARE INCLUDED WITH THE WILWOOD PROSPINDLE KIT

Figure 2. Installation Configuration For Standard Hieght Spindle, P/N 830-10832

ITEM NO.	PART NO.	DESCRIPTION	QTY
1	250-10637	Bracket, Caliper Mounting	2
2	240-3902	Shim, .016" Thick	16
3	230-6959	Stud, 1/2-20 x 2.00" Long, 12 Point	10
4	270-6989	Hub Assembly	2
5	370-0884	Cone, Inner Bearing	2
6	380-0885	Seal, Grease	2
7	160-13174	Hat/Rotor Assembly, Carbon Ceramic, 1.25" Thk x 14.00" Dia, 12 x 8.75" Bolt Circle	2
8	370-0882	Cone, Outer Bearing	2
9	240-2444	Washer, 7/8" Spindle	2
10	230-9548	Nut, Spindle	2
11	300-9549	Retainer, Nut	2
12	180-9541	Pin, Cotter	2
13	211-1674	O-ring	2
14	270-2158	Cap, Dust	2
15	230-10419	Bolt, 1/4-20 x .50" Long, Flat Head	6
16	120-13289/90-BK	Caliper, Aerolite 6R (one each, right and left)	2
16A	120-13289/90-RD	Caliper, Aerolite 6R, Red (one each, right and left)	2
17	230-9182	Nut, 7/16-20 Self-Locking Hex Head	4
18	240-11101	Washer, .453" I.D. x .750" O.D. x .063" Thick	4
19	230-9080	Stud, 7/16-14 x 7/16-20 x 3.375" Long (pre-installed in bracket)	4
20	240-1848	Shim, .030" Thick	12
21	150-15193K	Pad, PCM Compound, Axle Set	1

NOTES:

P/N 230-14200 Bolt Kit, wheel studs, includes part number 230-6959

P/N 160-13174 Rotor Assembly, includes P/N's 160-12442, 170-13136 and 230-12759

P/N 230-7032 Bolt Kit, hub to hat, includes part number 230-10419

P/N 250-10640 Bracket Kit, bracket to spindle/caliper to bracket, includes P/N's 230-9080, 230-9182, 240,1848, 240-11101, 240-3902 & 250-10637

P/N 370-10090-2 Locknut Kit, includes part numbers 180-9541, 230-9548, 240-2444 and 300-9549

Item 16A is an optional item and is included in the "-R" red caliper kits. Add "-R" to end of part number when ordering.

General Information

Installation of this kit should **ONLY** be performed by persons experienced in the installation and proper operation of disc brake systems. Before assembling the Wilwood disc brake kit, double check the following items to ensure a trouble free installation.

- Make sure this is the correct kit to match the Wilwood ProSpindle which was purchased separately.
- NOTE:** Refer to the correct diagram and instructions for your application. This kit fits both the standard height ProSpindle (P/N 830-10832), and the 2" drop ProSpindle (P/N 830-9807). However, some instruction steps differ between the two spindle types.
- Verify the new hub stud pattern in this kit matches the stud pattern of the vehicles wheels.
- Verify your wheel clearance using Figure 3.
- Inspect the package contents against the parts list to ensure that all components and hardware are included.

Assembly Instructions

NOTE: Numbers in parenthesis refer to the parts list and Figures 1 and 2 on the preceding pages.

•**NOTE:** Each Wilwood ProSpindle kit includes bolts, washers, and a spacer to mount the steering arm and caliper bracket. The various bolts are identified by length in the following instructions and in Figures 1 and 2.

For 2" Drop ProSpindle (P/N 830-9807): The caliper bracket assembly (1) should initially be installed with clean, dry threads on the mounting bolts.

- Orient the bracket as shown in Figure 1 and Photo 1. Install at top spindle hole using 1.25" long bolt and .06" thick washer (from ProSpindle kit), and two .016" thick shims (2) between the bracket and spindle, Figure 1.
- Orient the steering arm, and identify the hole marked 'A', as shown in Figure 1. Install at bottom spindle hole using 2.00" long bolt, .06" thick washer (from ProSpindle kit), two .016" thick shims (2) between the steering arm and the bracket, and another two more .016" thick shims (2) between the bracket and spindle, Figure 1. The bracket is located between the steering arm and spindle. **NOTE:** The bracket and shim washers must add up to a total thickness of .550" ± .010", Figure 1.
- Finish attaching the steering arm through the hole marked 'B', as shown in Figure 1. Install using 2.25" long bolt, .06" thick washer, and .25" thick spacer (all from ProSpindle kit), Figure 1.
- Temporarily tighten all mounting bolts. **NOTE:** The bracket and steering arm must fit squarely against the mounting points on the spindle. Inspect for interference from casting irregularities,

Figure 3. Wheel Clearance Diagram

Photo 1

Assembly Instructions (Continued)

machining ridges, burrs, etc. Later, after the caliper alignment has been checked, the mount bolts will be secured using red Loctite® 271.

For Standard Height ProSpindle (P/N 830-10832): The caliper bracket assembly (1) should initially be installed with clean, dry threads on the mounting bolts.

- Orient the bracket as shown in Figure 2 and Photo 2. Install using 1.25" long bolts and .06" thick washers (from ProSpindle kit), and two .016" thick shims (2) on each bolt between the bracket and spindle, Figure 2. Temporarily tighten mounting bolts. **NOTE:** *The bracket must fit squarely against the mounting points on the spindle.* Inspect for interference from casting irregularities, machining ridges, burrs, etc. Later, after the caliper alignment has been checked, the mount bolts will be secured using red Loctite® 271.

- Orient the steering arm, and identify the hole marked 'A', as shown in Figure 2. Install using 1.75" long bolt, .06" thick washer, and .30" thick spacer (all from ProSpindle kit), Figure 2.

- Finish attaching the steering arm through the hole marked 'B', as shown in Figure 2. Install using 2.00" long bolt and .06" thick washer (from ProSpindle kit), Figure 2.

- Temporarily tighten mounting bolts. **NOTE:** *The steering arm must fit squarely against the mounting points on the spindle.* Inspect for interference from casting irregularities, machining ridges, burrs, etc. Remove the steering arm mounting bolts one at a time, apply red Loctite® 271 to the threads, and torque to 55 ft-lb.

Photo 2

Photo 3

Photo 4

- Install wheel studs (3) into the hub (4), Photo 3. Torque to 77 ft-lb. **NOTE:** *There are two five lug patterns in the hub (5 x 4.50 and 5 x 4.75).* Ensure the correct hub stud pattern is being used to fit the wheel application.

- Pack the large inner bearing cone (5) with high temperature disc brake bearing grease (available from your local auto parts store) and install into the backside of the hub (4), Photo 4.

- Install the grease seal (6) by pressing into the backside of the hub (4), flush with the end of the hub, Photo 4.

- Pack the small outer bearing cone (8) with high temperature disc brake bearing grease and install into hub (4). Slide the hub assembly onto the spindle. Secure using spindle washer (9) and adjusting nut (10), Photo 5. Bearing adjustment: Tighten the nut while turning the hub. When there is a slight bind on the bearings, they are seated correctly. Back the nut off about 1/6 to 1/4 of a turn, or sufficiently to allow .001" to .007" end play. **WARNING:** *Failure to back off adjusting nut could cause bearing to run hot and be damaged, which could cause the wheel to lock or come off.* Install spindle nut retainer (11) and cotter pin (12).

Photo 5

Photo 6

- Screw dust cap (14) into hub (4), Photo 6. Friction created by the o-ring (13) on the dust cap keeps it from unscrewing.

Assembly Instructions (Continued)

•The hat/rotor assembly (7) has been pre-assembled at the factory using red *Loctite*® 271 on the mounting bolts and torqued to specification. For an added measure of security, the bolts may be safety wired using standard 0.032 inch diameter stainless steel safety wire as shown in Figure 4. Please refer to Wilwood's data sheet DS-386 (available at www.wilwood.com/Pdf/DataSheets/ds386.pdf) for complete safety wire installation instructions.

Figure 4. Safety Wire Diagram

Photo 7

•Slide the hat/rotor (7) onto the hub (4) taking care to align the small countersunk holes in the hat with the small threaded holes in the hub. **NOTE:** *The hat must fit flush against the hub face or excessive rotor run out may result.* Install three flat head screws (15) through the small holes in the hat, Photo 6, and torque to 85 in-lb.

•**NOTE:** *This kit contains distinct right and left hand calipers that must be mounted in a specific direction, as described below.* Lubricate the caliper mounting studs (19) with lightweight oil. Initially place two .030" thick shim (20) on each stud between the caliper and the bracket, as shown in Figure 1 or 2, and Photo 7. Mount the caliper (16) onto the bracket (1) using lock nuts (17) and washers (18), Figure 1 or 2. Ensure that the caliper is mounted so the largest pistons are at the rotor exit end of the caliper, in relation to the direction of rotor rotation. Temporarily tighten the lock nuts. View the rotor through the top opening of the caliper. The rotor should be centered in the caliper, Photo 8. If not, proceed as follows:

Photo 8

Photo 9

For 2" Drop ProSpindle (P/N 830-9807)

•Adjust by adding or subtracting shims (2) between the bracket and the spindle. Always use the same amount of shims on each of the two bolts between bracket and spindle.

•For the lower bracket mount bolt, if a shim was added between the bracket and spindle, then a shim must be removed between the steering arm and bracket, such that the total thickness of bracket and shims remain equal to $.550 \pm .010$ ", Figure 1.

•Conversely, if a shim was removed between bracket and spindle, one must be added between steering arm and bracket. Again, maintaining a total thickness of $.550 \pm .010$ ".

Photo 10

Photo 11

For Standard Height ProSpindle (P/N 830-10832)

•Adjust by adding or subtracting shims (2) between the bracket and the spindle. Always use the same amount of shims on each of the two mounting bolts.

•Once the caliper alignment is correct, remove the ProSpindle supplied bolts one at a time, apply red *Loctite*® 271 to the threads, and torque to 55 ft-lb.

•Remove the two pad retaining pins from the caliper by carefully popping out the pin retaining clips and sliding out the pins. Insert the brake pads (21) into the caliper from the bottom, Figure 1 or 2, and Photo 9, with the friction material facing the rotor. Secure the brake pads in place with the pad retaining pins and clips, Photo 10. Reinstall the caliper onto the mounting bracket and

temporarily tighten the lock nuts. Check that the top of the brake pad is flush with the outside diameter of the rotor, Photo 11. If not, adjust by adding or subtracting shims (20) between the caliper and the bracket. After the caliper pad height is set, torque the caliper lock nuts (17) to 47 ft-lb.

•Temporarily install the wheel and torque lug nuts to manufacturer's specification. Ensure that the wheel rotates freely without any interference. Remove wheel for next step.

•**NOTE:** *The caliper in this brake kit utilizes a 1/8-27 NPT pipe thread inlet. OEM rubber brake hoses generally cannot be adapted to Wilwood calipers. The preferred method is to use steel adapter fittings at the caliper, either straight, 45 or 90 degree (use PTFE tape on pipe threads of adapter fitting for proper*

Assembly Instructions (Continued)

sealing to caliper) and enough steel braided line to allow for full suspension travel and turning radius, lock to lock. **Carefully route hoses to prevent contact with moving suspension, brake or wheel components.** *NOTE: Wilwood hose kits are designed for use in many different vehicle applications and it is the installer's responsibility to properly route and ensure adequate clearance and retention for brake hose components.* Wilwood offers universal brake flex line hose kits, both domestic (3/8-24 IF) and metric (10mm x 1.0), order:

P/N 220-7056 for the 14 inch length domestic, 3/8-24 IF

P/N 220-7699 for the 16 inch length domestic, 3/8-24 IF

P/N 220-8307 for the 18 inch length domestic, 3/8-24 IF

P/N 220-8338 for the 14 inch length metric, 10mm x 1.0

P/N 220-6856 for the 18 inch length metric, 10mm x 1.0

Hose kits include hoses, fitting, etc., all in one package for this application.

NOTE: Specified brake hose kits may not work with all Years, Makes and Models of vehicle that this brake kit is applicable to, due to possible OEM manufacturing changes during a production vehicle's life. It is the installer's responsibility to ensure that all fittings and hoses are the correct size and length, to ensure

proper sealing and that they will not be subject to crimping, strain and abrasion from vibration or interference with suspension components, brake rotor or wheel.

- In absence of specific instructions for brake line routing, the installer must use his best professional judgment on correct routing and retention of lines to ensure safe operation. Test vehicle brake system per the '**Minimum Test Procedure**' stated within this document before driving. After road testing, inspect for leaks and interference. Initially after install and testing, perform frequent checks of the vehicle brake system and lines before driving, to confirm that there is no undue wear or interference not apparent from the initial test. Afterwards, perform periodic inspections for function, leaks and wear in a interval relative to the usage of vehicle.
- Bleed the brake system, referring to the '**Additional Information and Recommendations**' on page 8 for proper bleeding instructions. Check system for leaks after bleeding.
- Install the wheel and torque to manufacturer's specifications.
- Bed-in the brake pads per the procedure on page 9.

Balancing the Brake Bias on 4 Wheel Disc Vehicles

•OE Style or Single Mount Race Pedal with Tandem Outlet Master Cylinder:

Front to rear caliper piston sizes, rotor diameters, and pad compounds must be initially configured to provide the correct range of vehicle bias when using a single bore / tandem outlet master cylinder. If excessive rear brake bias is experienced, an inline adjustable proportioning valve can be used to decrease the rear line pressure to help bring the vehicle into balance. If excessive front brake bias is experienced, first consideration should be given to increasing the rear brake bias to bring the vehicle into overall balance.

•Race Pedal with Dual Master Cylinders and Balance Bar:

Master cylinders must be sized to match the calipers and allow the pedal balance bar to operate near the center of its travel. If it is not possible to fine tune the bias within the adjustable range of the balance bar, then consideration must be given to changing a master cylinder bore size or some other aspect of the brake system to bring the car into balance. Larger bore master cylinders will generate less pressure while decreasing pedal travel. Smaller bores master cylinders will generate higher line pressures with an increase in pedal travel.

Additional Information and Recommendations

• Fill and bleed the new system with Wilwood Hi-Temp^o 570 grade fluid or higher. For severe braking or sustained high heat operation, use Wilwood EXP 600 Plus Racing Brake Fluid. Used fluid must be completely flushed from the system to prevent contamination. **NOTE:** *Silicone DOT 5 brake fluid is **NOT** recommended for racing or performance driving.*

• To properly bleed the brake system, begin with the caliper farthest from the master cylinder. Bleed the outboard bleed screw first, then the inboard. Repeat the procedure until all calipers in the system are bled, ending with the caliper closest to the master cylinder. **NOTE:** *When using a new master cylinder, it is important to bench bleed the master cylinder first.*

• If the master cylinder is mounted lower than the disc brake calipers, some fluid flowback to the master cylinder reservoir may occur, creating a vacuum effect that retracts the caliper pistons into the housing. This will cause the pedal to go to the floor on the first stroke until it has “pumped up” and moved all the pistons out against the pad again. A Wilwood in-line two pound residual pressure valve, installed near the master cylinder will stop the fluid flowback and keep the pedal firm and responsive.

• Test the brake pedal. It should be firm, not spongy and stop at least 1 inch from the floor under heavy load.

If the brake pedal is spongy, bleed the system again.

If the brake pedal is initially firm, but then sinks to the floor, check the system for fluid leaks. Correct the leaks (if applicable) and then bleed the system again.

If the brake pedal goes to the floor and continued bleeding of the system does not correct the problem, a master cylinder with increased capacity (larger bore diameter) will be required. Wilwood offers various lightweight master cylinders with large fluid displacement capacities.

• **NOTE:** *With the installation of after market disc brakes, the wheel track may change depending on the application. Check your wheel offset before final assembly.*

• On some models of disc brake spindles there are “ears” where the OEM calipers were mounted and these “ears” interfere with the assembly of the Wilwood disc brake kit. If it becomes necessary to remove these “ears”, remove as little as possible being careful not to cut away any of the mounting holes that may be required to bolt on the caliper mounting bracket.

• If after following the instructions, you still have difficulty in assembling or bleeding your Wilwood disc brakes, consult your local chassis builder, or retailer where the kit was purchased for further assistance. Additional information is available on Wilwood’s web site at www.wilwood.com or e-mail info@wilwood.com.

Brake Testing

WARNING • DO NOT DRIVE ON UNTESTED BRAKES BRAKES MUST BE TESTED AFTER INSTALLATION OR MAINTENANCE MINIMUM TEST PROCEDURE

- Make sure pedal is firm: Hold firm pressure on pedal for several minutes, it should remain in position without sinking. If pedal sinks toward floor, check system for fluid leaks. DO NOT drive vehicle if pedal does not stay firm or can be pushed to the floor with normal pressure.
- At very low speed (2-5 mph) apply brakes hard several times while turning steering from full left to full right, repeat several times. Remove the wheels and check that components are not touching, rubbing, or leaking.
- Carefully examine all brake components, brake lines, and fittings for leaks and interference.
- Make sure there is no interference with wheels or suspension components.
- Drive vehicle at low speed (15-20 mph) making moderate and hard stops. Brakes should feel normal and positive. Again check for leaks and interference.
- Always test vehicle in a safe place where there is no danger to (or from) other people or vehicles.
- Always wear seat belts and make use of all safety equipment.

Pad and Rotor Bedding

BEDDING STEPS FOR NEW PADS AND ROTORS – ALL COMPOUNDS

Once the brake system has been tested and determined safe to operate the vehicle, follow these steps for the bedding of all new pad materials and rotors. These procedures should only be performed on a race track, or other safe location where you can safely and legally obtain speeds up to 65 MPH, while also being able to rapidly decelerate.

- Begin with a series of light decelerations to gradually build some heat in the brakes. Use an on-and-off the pedal technique by applying the brakes for 3-5 seconds, and then allow them to fully release for a period roughly twice as long as the deceleration cycle. If you use a 5 count during the deceleration interval, use a 10 count during the release to allow the heat to sink into the pads and rotors.
- After several cycles of light stops to begin warming the brakes, proceed with a series of medium to firm deceleration stops to continue raising the temperature level in the brakes.
- Finish the bedding cycle with a series of 8-10 hard decelerations from 55-65 MPH down to 25 MPH while allowing a proportionate release and heat-sinking interval between each stop. The pads should now be providing positive and consistent response.
- If any amount of brake fade is observed during the bed-in cycle, immediately begin the cool down cycle.
- Drive at a moderate cruising speed, with the least amount of brake contact possible, until most of the heat has dissipated from the brakes. Avoid sitting stopped with the brake pedal depressed to hold the car in place during this time. Park the vehicle and allow the brakes to cool to ambient air temperature.

COMPETITION VEHICLES

- If your race car is equipped with brake cooling ducts, blocking them will allow the pads and rotors to warm up quicker and speed up the bedding process.
- Temperature indicating paint on the rotor and pad edges can provide valuable data regarding observed temperatures during the bedding process and subsequent on-track sessions. This information can be highly beneficial when evaluating pad compounds and cooling efficiencies.

POST-BEDDING INSPECTION – ALL VEHICLES

- After the bedding cycle, the rotors should exhibit a uniformly burnished finish across the entire contact face. Any surface irregularities that appear as smearing or splotching on the rotor faces can be an indication that the brakes were brought up to temperature too quickly during the bedding cycle. If the smear doesn't blend away after the next run-in cycle, or if chatter under braking results, sanding or resurfacing the rotors will be required to restore a uniform surface for pad contact.

PRE-RACE WARM UP

- Always make every effort to get heat into the brakes prior to each event. Use an on-and-off the pedal practice to warm the brakes during the trip to the staging zone, during parade laps before the flag drops, and every other opportunity in an effort to build heat in the pads and rotors. This will help to ensure best consistency, performance, and durability from your brakes.

DYNO BEDDED COMPETITION PADS AND ROTORS

- Getting track time for a proper pad and rotor bedding session can be difficult. Wilwood offers factory dyno-bedded pads and rotors on many of our popular competition pads and **Spec 37** GT series rotors. Dyno-bedded parts are ready to race on their first warm up cycle. This can save valuable time and effort when on-track time is either too valuable or not available at all, Dyno-bedding assures that your pads and rotors have been properly run-in and are ready to go. Contact your dealer or the factory for more information on Wilwood Dyno-Bedding services.

NOTE: NEVER allow the contact surfaces of the pads or rotors to be contaminated with brake fluid. Always use a catch bottle with a hose to prevent fluid spill during all brake bleeding procedures.
